master s thesis from the year 2009 in the subject agrarian studies grade 1 california polytechnic state university language english abstract microalgae are
 considered one of the most promising feedstocks for biofuel production for the future the most efficient way to produce vast amounts of algal biomass is the use of
 closed tubular photobioreactors pbr the heat requirement for a given system is a major concern since the best algae growth rates are obtained between 25 30 c

depending on the specific strain a procedure to determine temperature influence on algal growth rates was developed for a lab scale pbr system using the species *Chlorella* a maximum growth rate of 1.44 doublings per day at 29 °C optimal temperature was determined in addition a dynamic mathematical model was developed to simulate heating and cooling energy requirements of tubular pbrs for any desired location operating the model with hourly weather data as input heating and cooling loads can be calculated early in the planning stage of a project furthermore the model makes it possible to compare the operation inside a greenhouse to the outdoor operations and consequently provides fundamental information for an economic feasibility study the best configuration for a specific location can be evaluated easily the model was exemplarily tested for a hypothetical 100 000 l photobioreactor located in San Luis Obispo California U.S. average algae productivity rates of 23 and 67 for outdoor and indoor pbr operations respectively were obtained actual energy loads heating and cooling needed to maintain the pbr at optimal temperature were determined and compared sensitivity analyses had been performed for abrupt temperature and solar radiation steps pbr row distances ground reflectivities and ventilation rates of the greenhouse an optimal row distance of 0.75 m was determined for the specific pbr the least amount of energy was needed for a ground reflectivity of 20%
